

What does event mean in JavaScript?

In JavaScript, an event is the object that the browser gives to your function when something happens on the page, such as a click, key press, scroll, or input.

Your code:

```
const main = document.querySelector("main");
main.addEventListener("click", (events) => {
  console.log(events);
});
```

Here, "click" is the event type. It means the function should run whenever the user clicks inside the main element.

The variable named "events" receives the click event object. This object contains details about the click, like what was clicked and where the mouse was.

Common event properties:

event.type -> tells the event name, for example "click"

event.target -> tells the exact element that was clicked

event.clientX -> tells the mouse X position

event.clientY -> tells the mouse Y position

Usually developers name this parameter "event" or "e", like this:

```
main.addEventListener("click", (event) => {
  console.log(event.target);
});
```

In simple words:

event is the click report/details sent by the browser to your function.
